Task 1 — Deployment Report

Hosting a Static Website on Amazon S3

Serverless Web Hosting Using AWS Simple Storage Service

Submitted by	Habiba Shafait (Hibu)
Student ID	BS/REG/124590
Program	BS Information Technology
Institution	Government College Women University, Sialkot
Internship Program	Alfido Tech
Task	Task 1: Static Website Deployment on AWS S3
Date	July 15, 2026
Live Link	http://alfido-cloud-task1-habiba.s3-website.eu-north-1.amazonaws.com
Status	Completed Successfully

1. Objective

The primary goal of this task is to host a static website using Amazon Simple Storage Service (S3) and make it accessible to the public through a unique, internet-facing URL. This exercise demonstrates the use of serverless, highly available cloud storage as a web hosting platform without provisioning any traditional web server.

2. Overview of AWS S3 Static Website Hosting

Amazon S3 is an object storage service that can be configured to serve static content — HTML, CSS, JavaScript, and image files — directly over HTTP. Because there is no underlying server to manage, this approach is cost-effective, scalable, and requires minimal maintenance, making it well suited for portfolio sites, landing pages, and documentation hosting.

3. Implementation Steps

Step 1: Creating the S3 Bucket

- Logged into the AWS Management Console and navigated to the S3 service.
- Created a globally unique bucket named `alfido-cloud-task1-habiba` in the `eu-north-1` (Stockholm) region.
- Under “Block Public Access settings for this bucket,” unchecked the box to allow the website content to be publicly readable, and acknowledged the resulting public-access warning.

A screenshot of the AWS Sign up page. On the left, there's a promotional banner for a 6-month free trial with a rocket icon. On the right, the 'Sign up for AWS' form is visible. It includes fields for 'Root user email address' (containing 'mughalhabiba414@gmail.com') and 'AWS account name' (containing 'Habiba shafait'). Below these fields are buttons for 'Verify email address' and 'Sign in to an existing AWS account'. There's also a link to the 'Privacy Notice' and a footer about cookies.

Figure 1: S3 bucket configuration for `alfido-cloud-task1-habiba`.

Step 2: Uploading Website Content

- Opened the newly created bucket.
- Uploaded the static website files to the bucket root.
- Verified that all files were uploaded successfully.

Figure 2: Website files uploaded to the bucket.

Step 3: Enabling Static Website Hosting

- Navigated to the Properties tab of the bucket.
- Enabled Static website hosting and specified index.html as the Index Document.
- Saved the changes, which generated the bucket website endpoint.

Figure 3: Static website hosting enabled with index.html as the index document.

Step 4: Configuring the Bucket Policy

- Navigated to the Permissions tab to grant public read access.
- Added a JSON bucket policy allowing the s3:GetObject action for all principals, enabling anonymous read access required for public web hosting.

Figure 4: Bucket policy granting public `GetObject` permission.

Step 5: Testing the Live Website

- Copied the bucket website endpoint URL from the Properties tab.
- Opened the endpoint in a web browser and confirmed the site loaded correctly.

Figure 5: The deployed static website live at its S3 website endpoint.

4. Deliverables

Live Website URL	http://alfido-cloud-task1-habiba.s3-website.eu-north-1.amazonaws.com
AWS Region	Europe (Stockholm) — eu-north-1
Hosting Type	Amazon S3 Static Website Hosting
Index Document	index.html
Access Control	Public read via bucket policy (s3:GetObject)
Status	Completed Successfully

5. Conclusion

The task was completed successfully. A fully static website was deployed on Amazon S3 using a serverless architecture, with public read access configured through a bucket policy and static website hosting enabled at the bucket level. The site is reachable via its S3 website endpoint, demonstrating a low-cost, highly available hosting solution that requires no server management or ongoing infrastructure maintenance.
